Marking summary

Pass: 32 / 40 (80%) AND all three gating questions correct — B7, C1, C2.

Section	Marks
A · Multiple choice	20
B · Short answer	12
C · Applied	8

Section A — answer row

Q	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10
Ans	b	b	b	c	b	b	b	b	c	a

Q	A11	A12	A13	A14	A15	A16	A17	A18	A19	A20
Ans	b	b	c	a	c	c	a	b	b	c

Notes on common wrong answers

- **A2/A3** — a student choosing "strictest" for Extreme has the sensitivity model inverted. Re-teach with the zone count demonstration before sign-off.
- **A4** — option a or d indicates the percentage is being read as a prediction or as buy/sell pressure. Correct immediately; it is the most consequential misreading in the course.
- **A10** — the answer is *higher prices*. A student answering b) has the sweep logic backwards and will trade it the wrong way.
- **A14** — 125 across all timeframes, not per timeframe. A student answering 500 has confused zones with boxes.

Section B — model answers (1 mark each)

B1. Bar 2 must close **below bar 1's low**.

B2. Because it tests displacement using price and ATR rather than volume, so it remains valid where the volume feed is absent or unreliable.

B3. The volume was concentrated on one side — roughly a 35:65 split between the zone's halves. It describes construction, not strength or likelihood.

B4. The candle has closed and the result is locked.

B5. Changes intrabar: a liquidity sweep label. Does not: zones, MSS, BOS or equal levels. (*Either direction stated correctly earns the mark.*)

B6. Duplicate-level suppression — a repeat break of an already-marked level does not draw a second line.

B7. [G] Because the pivot would not yet be confirmed, so the level could change or vanish as later bars print — it would repaint. A level that arrives late but stays put can be planned around; one that arrives early and moves cannot.

- B8.** At true M15 width — the zone-width setting counts bars of the zone's own timeframe, so 15 M15 bars by default, not 15 M1 bars.
- B9.** Per-signal toggle off; Show BOS off for BOS alerts; the alert attached to a different or unsaved instance.
- B10.** Old zones missing, or zones drawn incompletely — a box with no volume bars or no text — because some of the four boxes per zone were discarded.
- B11.** Price trades through a recent high or low and then closes back inside it, against the direction of the run — a failed breakout. *(Any answer using "reversal" scores zero, per the question.)*
- B12.** Many gaps are never filled; a zone records what happened, and carries no commitment that price returns.

Section C — model answers (2 marks each)

- C1. [G]** Map → liquidity → sweep → shift (MSS) → the zone the shift left → invalidation → size. The indicator performs **steps 1 to 5** — it marks zones, equal levels, sweeps and structure. **Steps 6 and 7, invalidation and size, are the trader's** and the indicator has no opinion on them. *1 mark for the seven steps in order; 1 mark for correctly splitting 1–5 from 6–7. Both required for the gate.*
- C2. [G]** The sweep was a pause inside an ongoing move, not a turn: the absence of an MSS means structure never confirmed the rejection, and continued bullish BOS lines say the established direction is intact. What would change it: a close beyond the most recent opposing swing — a bearish MSS — ideally with a fresh zone left by that displacement. *1 mark for reading the sweep as a pause because no shift followed; 1 mark for naming the MSS close as the condition that would change it. Reject any answer that treats the sweep alone as a short trigger.*
- C3.** Full marks require the decision to be made in this order: define invalidation first — a body close back above the fresh zone, or above the sweep high — then measure that distance. If invalidation sits beyond the 15-point limit, there is no trade regardless of how good the sequence looks; the 40-point zone is context for a target or a higher-timeframe idea, not a reason to widen risk. Award 1 mark for invalidation-before-size, 1 mark for concluding that the risk limit, not the setup, decides whether the trade exists. *Deduct both marks if the student proposes widening the limit or "sizing down to fit" without addressing where invalidation actually sits.*
- C4.** Diagnosis: the drawing budget. Arithmetic: each rendered zone costs 4 boxes and 2 lines against a 500-box ceiling, so about 125 zones in total across all active timeframes — four timeframes at 125 each asks for roughly 2000 boxes and TradingView discards the oldest silently. Fix: lower Zones kept per timeframe to about 30 with four timeframes active, or run fewer timeframes. *1 mark for the diagnosis with the arithmetic, 1 mark for the corrective setting.*

Sign-off

Requirement	Met?
32 / 40 or better	
B7 correct	
C1 correct	
C2 correct	
Drill 11 worksheet seen, invalidation recorded before outcome	

⚠ Certification for this product remains **pending** at the Academy level until the v2.1 build passes the TradingView compile green-check and the owner signs off. Do not issue certificates describing the course as certified before that.
