

THECC Fair Value Gaps PRO — Practical Exercises

THECC Institutional Trader Academy™

 Course Metadata

Field	Value
Academy	THECC Institutional Trader Academy™
Course	Fair Value Gaps PRO
Module	2–4
Lesson	Practical Exercises
Difficulty	Beginner → Intermediate
Estimated Time	12 drills, 10–25 minutes each
Prerequisites	Student Guide Chapters 1–6
Indicator Version	v2.1
Document Version	v2.1.0
Last Updated	2026-09-20
Instructor	Dale Batise
Status	Content Complete — Certification Pending

How these drills work

Each drill has an objective, a method, and a **success criterion you can verify yourself**. Use TradingView's Bar Replay for anything that involves waiting.

 **No drill in this document requires a live position.** Every one can be completed on replay or on historical charts. If you catch yourself wanting to "test it with a small trade", you have swapped a learning task for a gambling one.

Drill 1 — Prove the middle-bar rule (10 min)

Objective: see the rule reject something. **Method:** find three consecutive bars that leave a visible gap but carry **no** zone. Inspect bar 2's close against bar 1's high or low. **Success:** you can name which specific condition failed — the close, the size test, or the ATR jump check.

Drill 2 — The sensitivity count (15 min)

Objective: internalise that sensitivity is permissiveness. **Method:** on one fixed chart, count visible zones at Low, Normal, High and Extreme. **Success:** your four counts increase monotonically, and you can state the formula $\text{gap} \times \text{sensitivity} > \text{ATR}$ from memory.

Drill 3 — Balance reading (10 min)

Objective: stop reading the percentage as quality. **Method:** find one zone above 80% and one below 40%. Write what each says about the construction of the level. **Success:** neither sentence contains a prediction.

Drill 4 — Invalidation methods, side by side (15 min)

Objective: connect the setting to your stop placement. **Method:** find a zone that a wick pierced but no body closed through. Switch Zone Invalidation from Close to Wick and watch the zone retire. **Success:** you can state where your stop belongs under each setting, and which you will use.

Drill 5 — The Fix demonstration (10 min)

Objective: feel the difference between moving levels and stable ones. **Method:** in Auto, change chart timeframe three times and watch the zones change. Set Fix to your bias timeframe and repeat. **Success:** you can explain in one sentence why stable levels are a planning requirement, not a preference.

Drill 6 — Overlap hunt (20 min)

Objective: find agreement between timeframes. **Method:** Multi-Fix M5 / M15 / H1, zones kept at 35. Identify three prices where two or more timeframes overlap. Note what price did on arrival. **Success:** three documented overlaps with outcomes, and no claim that overlap guarantees anything.

Drill 7 — Reproduce the drawing-budget fault (15 min)

Objective: recognise the fault on sight, forever. **Method:** four Multi-Fix timeframes with zones kept at 125. Scroll back and find zones drawn without volume bars or text. Then set zones kept to 30 and reload. **Success:** you can describe the signature of the fault and the arithmetic behind it — 4 boxes per zone, 500 boxes total.

Drill 8 — Structure classification (20 min)

Objective: separate continuation from a shift. **Method:** find five structure events. Before reading the label, decide whether each is MSS or BOS from the swing it broke. Then check. **Success:** four of five correct, and the misses explained.

Drill 9 — Wick versus close (10 min)

Objective: trust the close requirement. **Method:** find a swing high pierced by a wick with no structure line, and one broken by a close with a line. **Success:** screenshots of both, captioned with why one counted.

Drill 10 — Sweep survey (25 min)

Objective: measure how often a sweep alone means anything. **Method:** log ten sweeps on replay. For each, record whether an MSS followed within ten bars, and what price did over twenty. **Success:** a ratio in your journal, and a sentence on what it implies for trading sweeps alone.

Drill 11 — Full sequence on replay (25 min)

Objective: run the seven steps without hindsight. **Method:** Bar Replay. Pause at the sweep. Write your invalidation **before** advancing. Advance bar by bar through the shift and the retrace. **Success:** a completed sequence worksheet where the invalidation was written before the outcome was known.

Drill 12 — Alert verification (15 min)

Objective: confirm your alerting actually works before you rely on it. **Method:** create `MSS (any)` and one "Any alert() function call" alert with prefix `THECC`. Wait for a structure event on a fast timeframe. **Success:** both messages received and archived; you can identify the level field in the dynamic message.

Instructor notes

- Drills 2, 7 and 10 produce the biggest behavioural change per minute spent. If you can only run three in a session, run those.
- Drill 11 is the assessment-grade exercise. Ask to see the worksheet where invalidation was written before the outcome; a student who cannot produce one has not met the course objective.
- Drill 10's ratio varies by symbol and session. Do not publish a target figure — the point is that each student measures their own market.
