**1. Title** — THECC Fair Value Gaps PRO · Student Course · Consistency Creates Freedom. **2. What this is** — A market map: zones, structure, equal levels, sweeps. No buy/sell signals. **3. What it is not** — Not a signal service · no probability grades · no opinion on direction. **4. Learning objectives** — The eight outcomes from the guide. **5. Why most gap tools fail** — Every three-bar gap drawn; chart becomes noise. **6. Two tests** — Middle bar must close through · move must be large vs ATR or volume-backed. **7. Ecosystem** — Map (this, SRM) vs execution (PEE) vs filter (MTSS). One job each. **8. Installation** — Pine Editor → Add to chart → Save (required for alerts). **9. Recommended chart** — Liquid symbol · standard candles · RTH while learning. **10. Anatomy of a zone** — 📸 annotated screenshot. **11. The volume split** — Upper/lower halves; total volume figure. **12. The percentage** — Balance, not quality. High = evenly split. **13. The midpoint** — 50% as the decision point. **14. Combined zones** — Merged overlaps; wider area; invalidation moves. **15. Historic zones** — The audit trail of levels you skipped. **16. Timeframe modes** — Auto · Fix · Multi-Fix. **17. Why Fix wins** — M15 levels on an M1 chart, at true M15 width. **18. Multi-Fix overlap** — 📊 H1 zone with nested M5 zones. **19. The cost** — Drawing budget; lower zones kept per timeframe. **20. Market structure** — BOS = continuation · MSS = the prior direction stopped. **21. Closes only** — Wicks are not events. **22. Equal highs and lows** — Shelves of stops; confirmed late by design. **23. Liquidity sweeps** — Run the level, close back inside. Failed breakout. **24. Naming trap** — "Buy-side" = the side taken. Evidence against that direction. **25. The sequence** — Map → liquidity → sweep → shift → zone → invalidation → size. **26. Worked example A** — 📸 sequence that held. **27. Worked example B** — 📸 sweep with no shift; continuation. **28. Where evidence is weakest** — Thin sessions · news · no volume feed · illiquid low timeframes. **29. Alerts** — Named conditions vs one alert() call; the

message format. **30. Bar-close gating** — What it changes and why it stays on. **31. Customization tiers** — Weekly settings vs Zone Engine. **32. Sensitivity is permissiveness** — Extreme 6.0 → Low 1.0. **33. Top mistakes** — Zone ≠ reason · sweep ≠ turn · tuning under pressure. **34. Close** — Invalidation before entry. Size last. Certification quiz next.
