

THECC Fair Value Gaps PRO — Troubleshooting Manual

THECC Institutional Trader Academy™

 Course Metadata

Field	Value
Academy	THECC Institutional Trader Academy™
Course	Fair Value Gaps PRO
Module	Reference
Lesson	Troubleshooting
Difficulty	Beginner → Intermediate
Estimated Time	15 minutes
Prerequisites	Student Guide Chapters 1–4
Indicator Version	v2.1
Document Version	v2.1.0
Last Updated	2026-09-20
Instructor	Dale Batise
Status	Content Complete — Certification Pending

Indicator	THECC Fair Value Gaps PRO · Registry ID pending
Version	v2.1.0
Build	2.1.0+2026-09-20
Release date	2026-09-20
Compatible indicator versions	FVG PRO v2.1.x
Academy Doc Standard	v1.0
Edition	Student / Pro · Status: Beta
Platform	TradingView · Pine Script v6
Copyright	© THE CONSISTENCY COLLECTIVE

Consistency Creates Freedom.

1 · Five checks before anything else

Run these in order. They resolve most reports.

#	Check	Why
1	Is the script saved , and is this the instance you configured?	Alerts and settings attach to a saved instance. Duplicates are the most common cause of "my settings did nothing".
2	Standard candles?	Heikin Ashi, Renko and Range bars synthesize prices. Everything downstream changes.
3	In Fix or Multi-Fix, is any timeframe slot blank ?	A blank slot draws nothing.
4	Multi-Fix on? What is Zones kept per timeframe ?	The drawing budget is the single biggest source of display faults. Section 2.

#	Check	Why
5	Does the symbol have a real volume feed?	Without one, the volume text and the Volume Threshold filter are meaningless. Use Average Range.

2 · The drawing budget

This is not a bug and it cannot be coded around. TradingView allows each indicator 500 boxes, 500 lines and 500 labels. The platform then discards the oldest objects **silently**.

Element	Cost
One rendered zone	4 boxes + 2 lines
One MSS or BOS event	1 line + 1 label
One equal-level shelf	1 line + 1 label
One liquidity sweep	1 label

500 boxes ÷ 4 = about 125 zones in total, across every active timeframe — not per timeframe.

Active detection timeframes	Set zones kept per timeframe to
1 (Auto or Fix)	100–125
2	55
3	35
4	30
5 (four slots + chart)	25

Caps that protect the label ceiling: **Max BOS lines** (50), **Max EQH/EQL drawings** (20), **Max sweep labels to keep** (50). Raising one takes room from the others.

3 · Display faults

Symptom	Diagnosis	Fix
Old zones missing	Box budget exhausted	Lower zones kept per the table in section 2
Zones drawn partly — box but no volume bars, or no text	Budget exhausted mid-zone: some of its four boxes were discarded	As above. This is the clearest signature of the budget fault.
Structure or sweep labels disappearing	Label ceiling reached	Lower Max sweep labels to keep , or Max BOS lines
No zones at all	Filter too selective · blank timeframe slot · symbol with no volume on Volume Threshold	Raise Detection Sensitivity toward Extreme · check slots · switch to Average Range
Zones only on recent bars	Max bars back to process (10000)	Raise it, accepting slower loading
Far fewer zones than a colleague	Different sensitivity, filter, detection type, session or symbol	Compare settings side by side before comparing charts
Zones changed when you changed chart timeframe	Detection is in Auto	Set Fix to your bias timeframe
Zone text reads FVG with no number	No volume feed	Expected. Use Average Range filtering.
Boxes dominate the chart	Presentation, not a fault	Skull Mode, or switch off Show Historic Zones
Zone starts earlier than you remember	Start Zones From = First Bar	Set to Last Bar, which reflects when the gap was confirmed

4 · Structure, equal levels and sweeps

Symptom	Diagnosis	Fix
No MSS or BOS lines	Show Market Structure off, or pivot length too high for the chart	Enable; lower pivot length toward 5

Symptom	Diagnosis	Fix
BOS never appears	Show BOS off — this gates detection, not just drawing	Enable it. BOS alerts also depend on it.
Structure ignored an obvious break	The break was a wick. Structure requires a close .	Working as designed
Only one line at a level that broke twice	Duplicate-level suppression	Working as designed
All structure lines vanished at once	Clear previous structure lines on each new MSS is on	Switch it off to keep history
Equal levels appear late	Pivots need bars on both sides to confirm	Working as designed — the alternative repaints
No equal levels at all	Tolerance too tight for the symbol	Raise Equal level tolerance % gradually
Sweep label appeared then vanished	Evaluated on the live bar; the close did not meet the condition	Working as designed. Only closed bars are evidence.
Far too many sweeps	Lookback too short for the level you care about	Raise it — 50–200 for long-standing levels
A sweep marked where price kept going	Sweeps mark failed breakouts, not reversals	Require an MSS before treating it as a turn

5 • Alerts

Work through in this order.

1. **Is the per-signal toggle on?** `÷ Alerts` has one switch per event. An off switch produces nothing in either alert mechanism.
2. **For BOS alerts, is Show BOS on?** Detection is gated by it.
3. **Is the alert attached to the current saved instance?** Delete and recreate after re-configuring.
4. **Which mechanism did you pick?** A named condition fires only that event. "Any alert() function call" fires every enabled event.
5. **Is the alert still active?** Check TradingView's expiry.

Symptom	Diagnosis	Fix
Nothing ever fires	Toggle off, or stale instance	Steps 1 and 3
Fires far too often	Equal-level or sweep alerts enabled	They default off for this reason — disable, or raise the sweep lookback
Fired, then price reversed the break	Bar-close gating off	Switch Fire on bar close only back on
Message has no level	You used a named condition	Use "Any alert() function call" for the dynamic message
Webhook rejects the payload	Prefix or format mismatch	Set Message prefix ; the format is <code><direction> <event> \ <ticker> \ <timeframe> \ level <price> \ close <price></code>
Two alerts for one event	A named condition and the dynamic route both active	Keep one

6 · Performance

Symptom	Diagnosis	Fix
Script times out or fails to load	Too many timeframes × zones × history	Fewer Multi-Fix slots, lower zones kept, lower max bars back
Slow chart when scrolling	Object count	As above; Skull Mode does not reduce object count materially
Slow only on one symbol	Very long history or thin data	Lower max bars back to process

💡 Cost order, highest first: number of active detection timeframes → zones kept per timeframe → max bars back to process. Reduce in that order.

7 · Escalation

Before raising an issue, capture:

1. Symbol, chart timeframe, session and chart type
2. Detection mode and, for Multi-Fix, every slot value
3. Detection Sensitivity, Zone Filtering, Zone Invalidation, Zones kept per timeframe
4. A screenshot showing the whole chart including the indicator name in the legend
5. The indicator version from the script header, and whether the script is saved
6. For alert issues: which mechanism, which condition name, and the exact message received

⚠ Two behaviors are frequently reported as faults and are neither: **the drawing budget** discarding old objects, and **equal levels arriving late**. Both are documented above and in the Student Guide.
